Selling Points of production process

Fushimi Exquisite water	Retort Heating Sterilization	X-Ray inspection

Fushimi-ku, Kyoto has been very famous for having the best quality of groundwater since the way back(about hundreds years ago). So that there are many sake brewery in this area. When it comes to producing Inari, water does matter too, We use Fushimi well water for manufacturing INARI, and this is the key to the very soft texture compared with other competitors.

We sterilize this products with a retort-packed food sterilizer at 119°C for 25 minutes. The results of an abuse test after storing an unopened package at 37°C for 14 days are as follows:
General live bacteria count: Less than 300/g Coliform bacteria and Staphylococcus aureus:

This machine can catch foreign materials, even tiny ones that can be hardly caught by human inspections.

NARI, and this pared with

Negative.

The results mean that the product is under "a commercial aseptic condition".
